NOVEMBER 16 – 29

The Swankas

DIRECTED BY JEPPE RONDE

IN DANISH WITH ENGLISH SUBTITLES

DIRECTED WITH DEBRA PORTER AND IMPEL PAYNE

HIS INITIAL DIAGNOSIS: Hysteria. In the course

of psychoanalyses conducted by Sigmund Freud

and his disciples, his case was regarded as a

classical example of hysteria. The case was

described in detail by Freud and his followers,

including Sigmund Freud himself. The case

was the first to be published in a scientific

journal, and it was later published in several

books and articles. The case was also

used as a teaching aid in medical schools,

and it was the subject of many

discussions and debates among

psychiatrists and psychoanalysts.

Hermann Lenz, a young psychiatrist

at the University of Vienna, first

saw the patient in 1873. He

was struck by the patient’s

unusual behavior and decided

to conduct a series of

experiments on her. He

conducted a series of

experiments on her,

including electrical

stimulation of her

nervous system, and

he observed that her

behavior changed

dramatically.

LENZ

Hermann Lenz was a

neurologist and

psychiatrist who

worked in Vienna,

Austria, in the 19th

century. He was

known for his

research into

neurological

disorders and

mental illness.

His initial diagnosis:

hysteria. He

conducted a series

of experiments on

the patient, and

he observed that

her behavior

changed dramatically.
